

# ScaffGap® FOR SYSTEM SCAFFOLDING

One of the most common causes of injury on construction sites is falling objects hitting site operatives. The gap created on a system scaffold such as Cuplok or K-Lok is nearly twice as wide as the gap on a tube and fitting scaffold and represents a very real hazard in terms of allowing hand tools, debris and other objects to fall through. It is also a real ankle-turner which, in turn, could cause a fall.

This new version of ScaffGap simply clips to the underside of a scaffold board and seamlessly covers the inherent gap. Manufactured from a high impact polymer, it has excellent load bearing qualities and will withstand everyday site use. **The constant standard centre's remove the necessity for cutting.** This makes it even quicker to install!
